

St. Johns RIVERKEEPER Candidate Survey

November 2018

Responses to this survey will be posted on our website at www.stjohnsriverkeeper.org and shared with over 20,000 members, followers and supporters throughout the state of Florida.

Threats to the River's Health

The health of the St. Johns River is threatened by the following:

- Pollution from excessive nutrients that cause toxic algae blooms, including fertilizers, stormwater runoff, municipal wastewater, septic tanks, sewage sludge (aka biosolids), industrial discharges, and agriculture;
- Fecal bacteria pollution from failing septic tanks, leaking sewage pipes, sanitary sewer overflows (SSO's), and animal waste;
- Over-pumping from the aquifer and reduced spring flows;
- Sedimentation from construction-site runoff that degrades water quality and the health of creeks and tributaries;
- Sea level rise that increases saltwater intrusion, water levels, and storm surge, and projects like dredging that will exacerbate these problems without mitigation;
- Loss of wetlands, springsheds, aquifer recharge areas, and other environmentally-sensitive lands due to rapid growth and development and lack of funding appropriated for acquisition;
- Elimination or weakening of environmental rules and regulations and lack of enforcement by state agencies for wastewater discharge and other permit violations.

1. ***What do you consider to be the biggest threats to the health of the St. Johns River and its watershed and, if elected, what will you do to address these problems?***

One of my main concerns and, if elected, one of my priorities would be to address sea level rise and higher storm surge. As we saw with Hurricane Irma, many neighborhoods in Jacksonville, including mine, are not prepared to absorb the impact of rising waters during storm events. If elected, I would fight for Land and Water Conservation Fund/Florida Forever dollars to be used as the voters intended and not allow elected officials to divert money out of these programs for inappropriate uses. Second, I would want to work with local governments, including here in Jacksonville, to ensure every city has a sustainability plan and long-term planning to make our communities as resilient and competitive as possible.

Pollution

Unfortunately, the St. Johns River and its tributaries are receiving too much nitrogen and phosphorous from failing septic tanks, stormwater runoff, fertilizers, wastewater treatment plants, industrial discharges, and sewage sludge.

Excessive nutrients feed uncontrolled algae blooms that deplete oxygen in the water needed by fish, reduce light that is essential to submerged aquatic vegetation (SAVs), and threaten the

health of both humans and aquatic life by emitting toxins. Toxic algal blooms and pollution also hurt businesses (marinas, kayak outfitters, fishing guides, realtors, boat dealers, restaurants, hotels, etc.), cost jobs, reduce property values and our tax base, and diminish recreational opportunities.

Potential policy solutions include: Increase awareness about proper use and application of fertilizers, increase funding to remove failing septic tanks, implement septic tank inspection programs, increase enforcement actions on utilities for frequent sewage spills and permit violations, and prohibiting use of sewage sludge near bodies of water.

1. ***What do you see as the most effective and necessary steps to protect the St. Johns from nutrient pollution and prevent algae blooms?***

While we've made some progress in reducing runoff with reuse and nutrient pollution with the passage of fertilizer ordinances in the past few decades, there is much work to do. One easy step is to assist the City of Jacksonville in ramping up the septic tank removal plan because it is good for the environment and our citizens. In addition, we need to ban the harmful practice of the disposal of sewage sludge near our river and its tributaries. Also, I support better protecting and restoring our wetlands so that our river is more properly equipped to filter out pollution and provide flood protection.

Septic Tanks

Thirty percent of the people in Florida rely on an estimated 2.6 million septic tanks for their wastewater disposal.

Thousands of these septic tanks are failing or malfunctioning, allowing bacteria, nitrogen, and other contaminants (pharmaceuticals, hormones, etc.) to leak into our waterways. While the 2017 Water Bill did provide programs and funding to remove some failing and poorly located septic tanks, more funding is needed and little is being done to curb the high volume of new septic tanks permits that are issued every day by county health departments. Developers of new subdivisions and single family homes are often not required or provided incentives to connect to existing water lines, or develop in areas where wastewater infrastructure already exists.

1. ***Would you support more funding for septic tank remediation and/or policies that protect waterways and sensitive lands by placing more stringent permit requirements on new septic tanks?***

Yes, I certainly would support septic tank removal and phasing out of using septic tanks where appropriate.

2. ***Would you support a septic tank inspection program and requirements to properly maintain and repair septic tanks, when necessary? If not, please explain your answer.***

I do support this. I think like other utilities, septic tanks should be up for inspection and be properly maintained.

Wetlands

Since the early 1900's, Florida has lost nearly 44% of its original wetlands. Yet, thousands of acres of wetlands continue to be destroyed each year throughout the state. Wetlands are critical for water quality, fish and wildlife habitat, groundwater recharge, storm and flood protection, and filters for our waterways. A 2015 University of North Florida economic study of the Lower St. Johns River found that "wetlands result in in almost \$3 billion dollars in savings for flood prevention or \$15,000 for each residence within the flood zone, and the wetlands provide an economic value for nutrient removal that exceeds \$400 million/year for Nitrogen and \$5.3 million /year for Phosphorous."

1. ***Which statement best describes your perceptions of our current wetland protections?***
 1. ***Current rules and regulations are sufficient to adequately protect wetlands.***
 2. ***Current rules and regulations are not sufficient to adequately protect wetlands and need to be strengthened or improved.***
 3. ***Current rules and regulations are excessive and need to be curtailed.***
 4. ***Current rules and regulations are sufficient but are burdensome to businesses and need to be curtailed in order to stimulate job growth.***

Statement number 2 - It is critical that we adequately protect Florida's wetlands. If elected, I will work to strengthen our ability to do so.

Water Conservation and Supply

The State of Florida is already reaching the sustainable limits of its predominant source of water, the Floridan Aquifer. Current water supply plans are looking to draw on surface water from our rivers and lakes in order to meet future demand. The St. Johns River Water Management District has developed plans to withdraw up to 160 million gallons of surface water a day from the St. Johns River. Removing millions of gallons a day from the flow of the river or its tributaries, such as Black Creek and the Ocklawaha River, will worsen existing pollution problems, increase salinity levels, and adversely impact the fisheries, wildlife, and submerged vegetation in and along the St. Johns. We are committed to preventing withdrawals and advocating for more sensible solutions, such as water conservation and the reuse of reclaimed water. Some of the proven conservation strategies include, tiered utility rates, incentives for the purchase of water-efficient plumbing fixtures and appliances, incentives for water-efficient landscaping and building practices, water audits, mobile irrigation labs, Consumptive Use Permit fees based on the quantity of water used, and building codes that require water-efficient fixtures and irrigation systems.

1. ***What will you do to demonstrate leadership on water conservation to ensure that proven reuse and conservation strategies are implemented and water is conserved and more efficiently utilized in Florida?***

I promise to work closely with groups like the St. Johns Riverkeeper, Sierra Club and others to make sure that thoughtful, scientific-based policies are advocated for and brought to debate in Tallahassee.

2. ***Currently, Consumptive Use Permits (CUPs) do not include a fee based on the quantity of water used by the applicant. Would you support a fee on water withdrawn from the aquifer?***

I'd like to learn more about this proposal in order to give a properly informed response.

Springs Protection

Florida's springs are unique and iconic natural treasures of our state, with a greater concentration of springs in Florida than in any other region of the world. More than 100 springs are located within the St. Johns River watershed providing approximately 30% of the flow. Unfortunately, many of our springs are in serious decline due to encroaching development, agricultural and urban runoff, groundwater pollution, failing septic tanks, and the reduction in levels of our underground aquifers.

As a result, many springs have experienced significant decreases in flow, water clarity, and fish biomass with alarming increases in nitrate levels and algal blooms. Silver Springs, a National Natural Landmark, is a perfect example of the tragic situation that is taking place. Discharge rates have declined from a historic average of about 824 cubic feet per second (cfs) to 465 cfs in 2017, which is a 43% reduction in flow since 1955. Fish biomass has decreased by 92%. Nitrates have increased from an average background level of less than 0.05 milligrams per liter (mg/l) to an average above 1 mg/l which represents about a 20- fold increase.

One of the major contributors to a decline in the health of Silver Springs is the existence of the Kirkpatrick Dam or Rodman Pool on the Ocklawaha River. The Dam has flooded more than 7,500 acres of forested wetlands, 16 miles of river and at least 20 springs. It also blocks passageway for migratory fish and manatees that historically wintered at Silver Springs.

1. ***What kinds of measures would you support to protect our springs and springsheds?***

Our springs and springsheds in North Florida are what makes our area so unique and beautiful. I would support limiting new developments from encroachment in endangered areas. Prioritizing use of the Land Acquisition Trust Fund to purchase conservation lands in our springs recharge areas would provide the much needed protection and access to these natural spaces..

2. ***Would you support breaching the Kirkpatrick Dam and restoring natural flow to the St. Johns, Ocklawaha, and Silver rivers? Why or why not?***

I would support exploring this thoroughly. It is important that everyone in the surrounding communities have an opportunity to be involved, informed and consulted.

Resiliency

It is estimated that 28% of Florida's total assets are located within the 100-year floodplain, or \$714 billion. Climate scientists are predicting slower, wetter and more intense storms, further increasing the risk to low-lying communities in the state. When widespread flooding occurs, water can infiltrate pipes causing sewer systems to back-up and sewage to be discharged into

nearby streets and waterways. Over 28 million gallons of wastewater spilled across Florida in the wake of Hurricane Irma. For septic tank users, rising groundwater levels prevent proper drainage, causing them to back up and overflow. Blooms that can be toxic to fish, wildlife, and humans can grow. Flood waters also often flush chemicals and contaminants from roads, parking lots and industrial and hazardous waste sites into surrounding neighborhoods and our river, creating additional health hazards.

1. ***What policies or programs would you support that aim to protect our communities from rising waters?***

I think a good start would be for cities to fully assess and understand vulnerabilities in order to strategically develop sustainability plans with goals to make communities more resilient to rising groundwater levels, flood waters and storm surge. I would work with expert agencies and organizations to draft legislation that would address these needs.

Growth Management

Growth management policies and programs that influence new development in order to promote sustainable communities and protect our environment have been cut or weakened in the last eight years. Incentives and requirements for redevelopment, green infrastructure, and low impact development are often not strong enough or do not exist in many communities. Unsustainable growth and the development of environmentally-sensitive regions of our state impacts water quality through wetland loss and stormwater runoff, makes us more vulnerable to storms and flooding, fragments wildlife corridors and destroys habitat, and requires costly new roads, infrastructure and services that some municipalities may not be able to adequately provide for its residents.

1. ***Do you support growth management policies that promote, encourage, or require sustainable development practices? If so, please describe the type of policies that you think are necessary to better manage growth in our state and more effectively protect our waterways and natural resources.***

Yes I do support growth management policies. Smart growth policies enhance quality of life, protect our natural systems and increases property values. More can be done by way of incentives for small, medium and large businesses who maintain “green” practices such as LEED buildings, solar panel usage and LED light bulbs. I think that taking an economic, business approach to growth management will be key to truly changing culture and promoting sustainability in our communities.

Conservation Land

A huge majority – over 75 percent – of Florida voters approved the Water and Land Conservation Amendment to the Florida Constitution in November 2014. The title was clear: “Dedicates funds to acquire and restore Florida conservation and recreation lands.” The amendment requires that 33 percent of the proceeds from the already existing real estate documentary-stamp taxes go for land acquisition. A judge ruled in June 2018 that the state

legislature to date has failed to appropriately allocate these funds based on the voter intent and the language of the State Constitution.

1. ***Do you think the Florida Legislature has properly and sufficiently allocated funds from the real estate documentary-stamp tax for land acquisition? What expenses do you think are appropriate for the use of these dedicated funds and what type of land conservation projects do you think should be prioritized by the state?***

No, the Florida Legislature has not acted properly in its failure to allocate funds based on voter intent. I think the amendment was clear in its description to restore and acquiring conservation and recreation lands.

I think that Senator Bradley's work to increase Florida Forever dollars was wise and something I certainly support. I think our Everglades and water supply are two things that the legislature needs to start investing in before it's too late.
